No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Score

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          DB

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            cc invention. The peptides of the invention have: (a) cytolytic activity on c pathogenic cells (pathogens and malignant cells not naturally present in cc pathogenic cells (pathogens and malignant cells not naturally present in cc concentration significantly higher than that at which they lyse concentration significantly higher than that at which they lyse concentrations (caused by bacteria, fungi, protozoa, mycoplasma or viruses) or cancer, in human and veterinary medicine. Also, they can be used as cc preservatives for food, cosmetics and agricultural produce, or as agricultural pesticides. The absence of haemolytic activity (associated with disturbance of alpha-helical structures) means that the peptides cc increased resistance to proteolytic degradation. Non-haemolytic, cytotoxic random copolymers of pardaxin, each has a specific spectrum of activity, allowing selection of agents for particular applications. Since resistance to them is unlikely to develop.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New non-haemolytic cytolytic agent useful in treating cancer infections - is a peptide comprising a moiety which disrupts

The cytolytic agents may be used for treatment of cancer or for treatment of several diseases caused by pathogens, including bacterial, fungal, viral, mycoplasma and protozoan infections. They may be used in both human and veterinary medicine. They may also be used as disinfectants for destruction of microorganisms, i.e. in solutions for wetting contact lenses, as preservatives, e.g., in the cosmetic and food industries, as pesticides (e.g. fungicides or bactericides) or for preservation of agricultural products.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       specification describes a non-haemolytic, cytolytic agent, which is a peptide, a complex of bundled peptides, a mixture of peptides or a random peptide copolymer. The agent has a selective cytolytic activity on pathogenic cells. The agent is selected from a cyclic derivative of a peptide which has a net positive charge greater than 1, comprises L-amino acid residues and/or D-amino acid residues and comprises an alpha-helix

infections (caused by bacteria, fungi, protozoa, mycoplasma or viruses) or cancer, in human and veterinary medicine. Also, they can be used as preservatives for food, cosmetics and agricultural produce, or as agricultural pesticides. The absence of haemolytic activity (associated with disturbance of alpha helical structures) means that the peptides have few if any toxic effects, and those that include D-aa will have increased resistance to proteolytic degradation. Non-haemolytic, cytotoxic random copolymers of pardaxin, each has a specific spectrum of activity, allowing selection of agents for particular applications. Sinc these random copolymers induce total lysis of bacterial cell walls, resistance to them is unlikely to develop.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Oren
                                                                                                                                                                                                                                                                              the body); but (b) no haemolytic activity, or such activity only at a concentration significantly higher than that at which they lyse pathogens. The peptides, their complexes and mixtures are used to treat
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Peptide(s) having selective cytolytic activity - against pathogens and malignant cells, but no haemolytic activity, used for treating

                                                                                                                                                                                                                                                                                                                                                                                                                                        This sequence represents a Leu/Lys diastereomer peptide of the invention. The peptides of the invention have: (a) cytolytic activity on the peptides of the invention have: (a) cytolytic activity on the peptides and malignant cells not naturally present in concentration significantly higher than that at which they lyse concentration significantly higher than that at which they lyse concentration significantly higher than that at which they lyse concentration significantly higher than that at which they lyse concentrations (caused by bacteria, fungi, protozoa, mycoplasma or viruses) concentratives for food, cosmetics and agricultural produce, or as concert in human and veterinary medicine. Also, they can be used as concentratives for food, cosmetics and agricultural produce, or as concentrative pesticides. The absence of haemolytic activity (associated have few if any toxic effects, and those that include D-aa will have concentrated resistance to proteolytic degradation. Non-haemolytic, concentrativity, allowing selection of agents for particular applications. Since these random copolymers of pardaxin, each has a specific spectrum of continuity, allowing selection of agents for particular applications. Since concentration to them is unlikely to develop.
                                                                                                                                                                                                                                                                                                                                                                    Query Match

                                                                                                                                                                                                                                                                                                                      850
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                a corresponding amino acid sequence comprising only 1-amino acid residues is not found in nature. The cytolytic agents may be used for treatment of several diseases caused by pathogens, including bacterial, fungal, viral, mycoplasma and protozoan infections. They may be used in both human and veterinary medicine. They may also be solutions for wetting contact lenses, as preservatives, e.g., in the cosmetic and food industries, as pesticides (e.g. fungicides or bactericides) or for preservation of agricultural products.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present peptide is used to produce the agents of the invention. The specification describes a non-haemolytic, cytolytic agent, which is a peptide, a complex of bundled peptides, a mixture of peptides or a random peptide copolymer. The agent has a selective cytolytic activity on pathogenic cells. The agent is selected from a cyclic derivative of a peptide which has a net positive charge greater than 1, comprises L-amino acid residues and/or D-amino acid residues and comprises an alpha-helix (comprises L-amino acid residues and D-amino acid residues, has a net positive charge greater than 1 and has an amino acid sequence such that a contractive charge greater than 1 and has an amino acid sequence such that
                                                                                                                                                                                                                                        19-MAY-1999

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            pathogenic cells. The agent is selected from a cyclic derivative of a peptide which has a net positive charge greater than 1, comprises L-amino acid residues and/or D-amino acid residues and comprises an alpha-helix breaker molety, or a peptide (or cyclic derivative of this) which (comprises L-amino acid residues and D-amino acid residues, has a net positive charge greater than 1 and has an amino acid sequence such that a corresponding amino acid sequence comprising only L-amino acid residues is not found in nature. The cytolytic agents may be used for treatment of cancer or for treatment of several diseases caused by pathogens, including bacterial, fungal, viral, mycoplasma and protozon infections. They may be used in both human and veterinary medicine. They may also be used a disinfectants for destruction of microorganisms, i.e. in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New non-haemolytic cytolytic agent useful in treating cancer infections - is a peptide comprising a moiety which disrupts continuity of an alpha-helical structure

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                cosmetic and food industries, as pesticides (e.g. fungicides or bactericides) or for preservation of agricultural products.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present peptide is used to produce the agents of the invention. The specification describes a non-haemolytic, cytolytic agent, which is a peptide, a complex of bundled peptides, a mixture of peptides or a random peptide copolymer. The agent has a selective cytolytic activity on

The present peptide is used to produce the agents of the invention. The specification describes a non-haemolytic, cytolytic agent, which is a peptide, a complex of bundled peptides, a mixture of peptides or a random peptide copplymer. The agent has a selective cytolytic activity on pathogenic cells. The agent has a selective cytolytic activity on pathogenic cells. The agent is selected from a cyclic derivative of a peptide which has a net positive charge greater than 1, comprises L-amino acid residues and/or D-amino acid residues and comprises an alpha-helix breaker moiety, or a peptide (or cyclic derivative of this) which comprises L-amino acid residues and D-amino acid sequence such that a corresponding amino acid sequence comprising only L-amino acid residues is not found in nature. The cytolytic agents may be used for treatment of
cancer or for treatment of several diseases caused by pathogens, including bacterial, fungal, viral, mycoplasma and protozoan infection. They may also
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Claim 14; Page 106; 126pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  where [1], P2, P3, and P4 = are each independently sequences of pharmacologically active peptides; L1, L2, L3, and L4 = are each independently linkers; and a, b, c, d, e, and f = are each independently 0 or 1, provided that at least 1 of a and b is 1. The composition can have cytostatic, antiasthmatic, thrombolytic and immunosuppressive activities. DNAs, vectors and host cells from the present invention can be used for producing pharmaceutical compositions. The compositions are useful for treating cancer, asthma, thrombosis, or autoimmune diseases. The use of an Fc domain (rather than a Fab domain) can provide a longer half-life or incorporate functions such as Fc receptor binding, protein A binding, complement fixation, and possibly placental transfer. AAAA6943 to AAA69526 and AAB16955 to AAB18003 represent nucleotide and amino acid sequences used in the exemplification of the present invention.

cc independently selected from -(Li)c-Pi, -(Li)c-Pi-(L2)d-P2, (L3)e-P3, or -(Li)c-Pi-(L2)d-P2-(L3)e-P3-(L4)f-P4

cc where P1, P2, P3, and P4 = are each independently sequences of

cc pharmacologically active peptides; L1, L2, L3, and L4 = are each independently

cc independently linkers; and a, b, c, d, e, and f = are each independently

cc independently linkers; and a, b, c, d, e, and f = are each independently

cc or 1, provided that at least 1 of a and b is 1. The composition can

cc have cytostatic, antiasthmatic, thrombolytic and immunosuppressive

cc activities. DNAs, vectors and host cells from the present invention can

cc be used for producing pharmaceutical compositions. The compositions are

cc useful for treating cancer, asthma, thrombosis, or autoimmune diseases.

cc The use of an Fc domain (rather than a Fab domain) can provide a longer

cc half-life or incorporate functions such as Fc receptor binding, protein

cc A binding, complement fixation, and possibly placental transfer. AAA69443

cc to AAA69526 and AAB16955 to AAB18003 represent nucleotide and amino acid

sequences used in the exemplification of the present invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    This sequence represents a diastereomer peptide of the invention. This consequence is used in a "bundle sequence", which is created by binding 5 copies of this sequence to peptide 23 (see AAW35149). The peptides of the invention have: (a) cytolytic activity on pathogenic cells (pathogens and malignant cells not naturally present in the body); but (b) no consequence of the invention have: (a) cytolytic activity on pathogens cells (pathogens and malignant cells not naturally present in the body); but (b) no consequence of the peptides of their complexes and mixtures are used to treat infections consequence of consequence of consequence of the peptides, their complexes and mixtures are used to treat infections consequence of in human and veterinary medicine. Also, they can be used as preservatives for food, cosmetics and agricultural produce, or as agricultural preservatives consequence of halpha-helical structures) means that the peptides have few if any toxic effects, and those that include D-aa will have increased conjumers of pardaxin, each has a specific spectrum of activity, colours selection of agents for particular applications. Since these condom copolymers induce total lysis of bacterial cell walls, resistance to them is unlikely to develop.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Query Match

The agent is selected from a cyclic derivative of a C pethode which has a net positive charge greater than 1 comprises L-amino CC acid residues and/or D-amino acid residues and comprises an alpha-helix CC breaker molety, or a peptide (or cyclic derivative of this) which CC comprises L-amino acid residues and D-amino acid residues, has a net CC comprises L-amino acid residues and D-amino acid residues, has a net CC comprise CC contributive charge greater than 1 and has an amino acid sequence such that CC corresponding amino acid sequence comprising only L-amino acid tresidues CC is not found in nature. The cytolytic agents may be used for treatment of CC cancer or for treatment of several diseases caused by pathogens, CC including bacterial, fungal, viral, mycoplasma and protozoan infections. CC They may be used in both human and veterinary medicine. They may also be CC used as disinfectants for destruction of microorganisms, i.e. in CC commetic and food industries, as preservatives, e.g., in the CC cosmetic and food industries, as pesticides (e.g. fungicides or CC bactericides) or for preservation of agricultural products.

        Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Oncogene 18:7026-7033(1999).
-i- FUNCTION: INIBITS D53- AND P73-MEDIATED CELL CYCLE ARREST AND APOPTOSIS BY BINDING ITS TRANSCRIPTIONAL ACTIVATION DOMAIN.
FUNCTIONS AS AN UBIQUITIN LIGASE E3, IN THE PRESENCE OF E1 AND TOWARD P53 AND ITSELF. PERMITS THE NUCLEAR EXPORT OF P53 AND TARGETS IT FOR PROTEASOME-WEDIATED PROTEOLYSIS (BY SIMILARITY).
-i- COPACTOR: ZINC IS REQUIRED FOR UBIQUITIN LIGASE E3 ACTIVITY (BY

PERMITS THE NUCLEAR EXPORT OF P53 AND TARGETS IT FOR PROTEASOME-MEDIATED PROTEOLYSIS.

-!- COFACTOR: ZINC IS REQUIRED FOR UBIQUITIN LICASE E3 ACTIVITY. SUBUNIT: BINDS P53, P73, ARF(P14), RIBOSOMAL PROTEIN L5 AND SPECIFICALLY TO RNA. CAN INTERACTS ALSO WITH RETINOBLASTOMA PROTEIN (RB), E1A-ASSOCIATED PROTEIN P300 AND THE E2F1

TRANSCRIPTION FACTOR. NUCLEAR AND CYTOPLASMIC. EXPRESSED PREDOMINANTLY IN THE NUCLEOPLASM. INTERACTION WITH ARF(P14) RESULTS IN THE LOCALIZATION OF BOTH PROTEINS TO THE NUCLEOLUS. THE NUCLEOLAR LOCALIZATION SIGNALS IN BOTH ARF(P14) AND MDM2 MAY BE DEPARTMENT.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      - -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     DEPENDENT MANN
